

All About Doxing: A Full Guide

To start off this book, I'm sure most of you know what doxing is, otherwise you wouldn't have purchased this, but if you didn't, doxing is basically gathering people's information. Information such as addresses, phone numbers, credit cards, anything of that manner is considered doxing. I'm going to explain a variety of methods, to help you become a better and more knowledgeable doxer.

I'm going to go step-by-step, as if I'm doxing someone, and explain things that you can do to get more information. This way you can understand everything easier, and better. I'm going to mention tons of websites that can help you dox people, how to remove your information online, social engineering strategies, how to hack their emails and accounts, and all kinds of different methods that you can use.

I can guarantee you that you will learn tons of new things throughout this guide. There's a lot of things to do when you have somebody's dox. You can hack their emails, accounts, identity theft, threaten them, send them pizza, put ads of their address on [Craigslist](#) as prostitutes, or do basically anything! You have all of their personal information, it's up to you what you want to do. That's why it's also very important to remove all of your information online, so people can't do any of that to you. I will include a whole tutorial on it later on in the book.

If you're hardcore and really don't like them, which I don't suggest, you can swat them or water them. Swatting is when you get a whole swat team to break into their house, because they think there's a hostage in the house. There's many ways you can do this, but I will not include it in this tutorial, you can easily find it by researching or going to the deep web. You can also water them, by saying there's a fire inside of the house, and a fire truck will come and shoot their hose all over your house. Both of these methods are really scary, but they can get you in a LOT of trouble if you get caught! You can also put there dox on [4Chan](#) which can really screw them up.

Alright, so we're going to begin with some tips and easy methods that can help you out. The first thing I'm going to point out is [Truecaller](#).

[Truecaller](#) is a iPhone/iPod application that can get you people's addresses just with a phone number! Very few people know about this, and it's amazing. If you acquire somebody's phone number, you can type it into Truecaller on your iPhone/iPod touch device, and It will give you the city they live in, and even possibly the address. It doesn't guarantee a address, but it will at least always give you their city!

Another amazing way to get people's address from their phone number is a website. It's [ISearch](#). All you have to do is put their phone number, and there you go! It gives you a address, property info, their age, their neighbors, and area info! All with just a phone number!

Now we're going to discuss [Familysearch](#).

[Familysearch](#) is a website where you can get birth, marriage, death, probate, land, military, IGI records, and more! This website also allows you to find the SSN (social security number) of a deceased person. This site is absolutely amazing, and isn't that known. You can get addresses, and so much more information from it. Also, if you want to scare somebody, you can find a deceased family member, find their social security number from the site, and include it in your dox. Most people don't know you can get the SSN's of deceased people, and will be scared and curious as how you did it.

The website is [FamilySearch](#). Alright now, there's a lot of websites where you can get people's addresses, reverse phone numbers, IP address locators, and other information. I'm going to list them all for you on the next page. The one thing that I need to mention is for IP addresses, only use this site. It's the most accurate IP locator ever.

[MaxMind](#)

Now onto the sites:

[TelecoData](#)

(Reverse Area Code)

[Knowem](#)

(Get Usernames)

[Freeality](#)

(Name, City, And State)

[InfoSpace](#)

(Companies By Name, Category, Or City)

[WhoIs](#)

(If they have a website, this will find there domain information)

[Ancestry](#)

(Find there ancestors and deceased family members)

[Zillow](#)

(This site gives you house details)

[pipl](#)

[zabasearch](#)

[addresses](#)

[411](#)

[WhitePages](#)

[Lular](#)

[Abika](#)

[TinyEye](#)

(If you have a picture, but don't know their name, can look it up on this website and it will look through images and find profiles of where the picture was uploaded [spokeo](#))

Don't forget about the most powerful tool of all, [Google](#). Social engineering can be a big factor in a dox. It can also easily be done. One of the best methods that you can possibly use for social engineering, is using a fake phone number. Let's say you get your target's phone number, or his mom/dad's. You can call your target with your mom or dad's phone number, and they'll think that you're their son! Obviously it isn't as easy as I explained, you need to know what your target sounds like and think of a story or strategy to get something out of this.

The site that you can use for using a fake phone number is:

[CallerIDFaker](#)

Besides that, social engineering is an amazing skill to learn. You can simply get all of the information out of your target just by typing to them. There's a million strategies that you can use to get information, like add them on [Facebook](#) with a fake account, pretend to be interested in them (use a girl account), or do anything that'll work! Be creative, social engineering is definitely the best way to get information, as you don't have to do any work. The information comes right toward you!

Alright, so let's say that I want to dox somebody that pissed me off. Where should I start and how? I would start by, (you should know their username if you're going to dox them) going to [Knowem](#). Now you may have their [Facebook](#), and other websites that their username is registered on. You can look through these websites, and try to find more information about them. If you have their [Facebook](#), then you know their first and last name, which you can look up on websites like <http://spokeo.com> and all of the other ones listed above. If you for some reason cannot find their email after all of this, here's a method to get their email by adding them on [Facebook](#). So let's say you made a fake [Facebook](#) account and added them, and want their email. This is how:

Go to your email that is registered to your [Facebook](#), that you added them on. I'm not sure if this works for any other email providers other than Yahoo, as I've never tried it. Go to your inbox, and go to here

See the part with the box over it? It says [Facebook](#) Friends. You can click it and it imports all of your [Facebook](#) friends, including all of their emails. So you add your guy on a fake account, with a [Yahoo](#) email, and you can go to your email and get theirs! It's as simple as that, and with their email, you can look up more information about them on various sites. You can also get their IP by sending them emails, when they go to the link you provided, it will get their IP. A good one that is made by a user on HF is [WSpy](#). Alright so, now you know how to dox, but you have to make sure you can't be doxed yourself. To begin with, I suggest you look up your name on [Google](#). Make a list of every single profile and information that shows up, and delete all of your unwanted things that are on the internet. When I did this, so much useless things showed up like websites I made 5 years ago, and old information. Now you're going to want to remove your information off of sites like Spokeo, and other sites that can find your address. Here's a great tutorial on how to remove your information off of most sites. (this was not made by me, and I do not take credit for it.)

[Intelius](#) is a most well-known people search engine on Internet, it targets every Internet visitor. Many background search websites are affiliated with [Intelius](#). Many popular people search websites are associated with [Intelius](#). [Intelius](#) sells background information to anybody on anyone regardless who you are (unless you take an action to block it). The famous [DateCheck](#) site is also hosted by [Intelius](#). Their reports include your name, address, date of birth, court records, unlisted or mobile number, and other personal info as described in the last section.

You can search personal records by name, SSN, or by phone number, etc through [Intelius](#). As a courtesy, Intelius can 'opt out' your specific information from the [Intelius's](#) Search service. Your name as it appears in a particular record and the associated identifying information such as your address and phone number will be suppressed. To remove your personal information from [Intelius](#), they need some documents from you to confirm your identity. There are two ways to show your identity:

(1) You would need to fax a copy of your driver license, you can cross-out your photo and license number, they only require your name, address and DOB; (2) Send them a notarized form confirms your identity. At [Intelius](#), under their Privacy section, there are instructions on how to remove your personal information from [Intelius](#).

(2) [Acxiom](#) is probable the biggest personal information data provider behind the scene. It has been described as "one of the biggest companies you've never heard of." I used to trade its stock - ACXM. From reading their 10Q and 10K annual reports, I learned all big search engines such as [Google](#), [Yahoo](#)., [Lycos](#), [WhoWhere.com](#) etc are powered by [Acxiom](#). Last year, [Acxiom](#) generated over \$1.2 billion revenue from selling personal information. If you want to remove your private information from major search engines like [Google](#) or [Yahoo](#), this is the first step you should take - have [Acxiom](#) remove your personal information from its data source either through your own effort or through other online personal information removal websites. [Acxiom](#) has two databases. One database provide background check for businesses and law enforcements, and another database is provided for general public which powers the search engines. The data for businesses and law enforcements includes very sensitive financial information and social security numbers, your personal information cannot be removed from this database, but you can select to remove your personal information from the general public database. You can make such a request through email or phone call. Visit [Acxiom](#) website for details on how to remove your data from [Acxiom](#) or email privacy@acxiom.com, check their Privacy Statement. Be warned, it won't be easy to get it done without giving them more personal information first.

(3) [USSearch](#) : You might have heard or seen [USSearch](#) from TV or radio advertisements.

Many websites are associated with [USsearch](#). Like Intelius, they sell your background information to anyone. You can make a request to remove your personal records from them via a postal mail. You need to include your name and DOB in the mail letter. In addition, they want you to list the former addresses of 15 years as well as the aliases you use. As readers

pointed out, [USSearch](#) also require you to pay to remove. The best way to get updated information is go to [USSearch](#) and check out its new Privacy Policy.

(4) [WhitePages](#)- just like a regular hard copy white page book, [Whitepages](#) has an online directory which is available to anyone on Internet. The White page lists your name and address in its search results if your phone number is not under unlisted number. This information is not more serious than others mentioned above. Most info can be found on hard copy phone books. You can remove your information via an online form available on their website. In the form, you fill in your name, city, and state, and give a reason to remove, in the drop down list, you can select General Privacy Concerns as the reason to remove. Of course, the most serious personal information can be found at its Sponsor links after your name.

(5) [Yahoo](#) and [Lycos's](#) People Search are also powered by Acxiom. If you just want to remove very basic search info from [Yahoo](#), visit Yahoo Privacy Policy .

(6) [Peoplefinders](#) is a People Search site actually associated with Intelius. The company helps people find family members, friends, classmates, military buddies, old flames and most anyone else in the United States. People Finders also provides more than 40 years worth of historical records. [Peoplefinders](#) require you to write a letter and signed by you with the following information in the letter, your name, address, former addresses going back up to 20 years. Referring to [Peoplefinders](#) private policy for details on opt-out process.

(7) [Anywho](#),
[Address](#)
[Infospace](#)
[99lists](#),
[Peoplelookup](#)
[Phonebook](#),
[thepublicrecords](#)
[Zabasearch](#)
[backgroundcheckgateway](#)
etc

are all linked Intelius on personal background information check. Most of these sites provide phone number and address search only, but background and personal information check is done through Intelius .

(8) If you concerned about name/address search at [ZabaSearch](#) (which shows your history of address changes), you can contact [ZabaSearch](#) to remove you information from their search engine. [ZabaSearch](#) has an option out feature right after you clicked your name. Here's the full link to if you want to read the whole thing.

[Squidoo](#) If you want to remove your information off Spokeo, all you need to do is simply go here: [Spokeo Privacy](#) Then find your name, copy the url, and put it there

and it will completely delete you off of Spokeo's listing. You can do this to all of your family members, and whoever you want. If you follow these steps, you should be a LOT harder to find. This will make you basically anonymous, and you won't be able to be doxed. (that easily) You should now know how to DOX people, I hope you learned some new things throughout this tutorial. If you use those sites and engines/applications, most people are extremely easy to find.
