

lets us say you have just download a new album or game  
but all the files are .xxx and you need them to be  
zip's, rar's, mp3's etc.....  
then do the following

- create a new folder
  - put all the files needing editing in the new folder
  - then goto "run" in the start menu
  - type in CMD and click ok
- 
- the next thing needs a few bits of old dos commands
  - you need to navigate CMD to the folder where the files are
  - you can do this by 1st getting the total address of the folder
  - and then typing it in cmd with a "cd" in front

QUOTE

```
cd c:\xxx\yyy\ccc\
```

once you in the folder where the files are you can move on  
nb u can check you in the right folder by typing dir to get a list of files

- now type in....

QUOTE

```
rename *.* *.zip
```

Nb change the zip to what ever the extension needs to be (.rar, .mp3 ect)

all done

you should hv now changed the .\* to what ever you needed

happy downloading Benji

(by Benji)

nb to exit CMD type in "exit"
