

How to "hack" the local Administrator Account on your School Computer: Download and Install Ubuntu 12.04 to a Flash Drive

Once you have your flash drive, go to school.

Shut down the computer completely at school.

Plug the flash drive in

Turn the computer on, and look for a Boot Menu key option, usually ESC or F10/F12, and then repeatedly tap it.

Choose your flash drive.

When it loads, select "Try Ubuntu"

Open the little folder on the left hand side.

Open your Hard Drive (should be on top of list on folders)

Open the Windows Folder

Open the system32 Folder

Delete "Magnify.exe"

Copy "cmd.exe"

Paste "cmd.exe" as "Magnify.exe"

Shutdown and Reboot the Computer.

When Windows loads again, open the Ease of Access settings (little button in bottom left) and check "Magnify" and then click "Apply" and finally "Cancel"

Type "net user" into the Command Prompt that just popped up.

Find the admin account, usually Administrator

Type "net user administrator *"

Set the new password (WARNING: you can't see yourself type)

Login to that account.

#profit

You can now use an unrestricted Command Prompt window, install malicious software (rats, etc) onto the computer, and so much more.

was a little tutorial on how to hack school pc
