TIPS 1. Generally windows reserves 20% of the bandwidth provided by the Internet service providers. So if we can reduce the limit to 0, then we can use the complete bandwidth allocated for us.

Go to Start -> Run Type "gpedit.msc" to open the group policy editor.
Navigate to "Local Computer Policy" -> "Computer Configuration" -> "Administrative Templates" -> "Network" -> "QOS Packet Scheduler" -> "Limit Reservable Bandwidth."

Now, double-click on the option named "Limit Reservable Bandwidth" and change the value from 20 to 0.

TIPS 2. The third-party DNS servers are always better than the default BSNL DNS servers. So changing these can help you increase the download speed of the BSNL broadband.

Go to Start -> Control Panel -> Network and Sharing Center/Network Connections -> Open "Local Area Connection" and click on "Properties" button. Now click on "TCP/IP" and in the DNS address fields, replace the current DNS servers with the following two addresses. 208.67.222.222 and 208.67.220.220

Click "OK" and restart the Internet connection.

TIPS 3. For downloading, use Internet download manager software it will download files quickly.

TIPS 4. Avoid surfing and Downloading at the same time. (Particularly for BSNL Connections).

That's it! The above tips worked Good for me to increase my BSNL broadband speed.
