How to hack/change your Windows XP Boot Screen

HACKING THE XP BOOT SCREEN

This is a very simple trick to do if you have done the same for the logon screen and the start button. There are 2 ways to do this trick that I know about one is doing it manually and the other is using a program called bootxp. I am going to tell you the manual way to do it, but if you want to know the other way just let me know, so I can do an update to the guide. Now once you have downloaded your ntoskrnl.exe file save it a general location so that you will have easy access to it, like my folder.

Once you have ntoskrnl.exe file in an easy access folder, restart your pc into safe mode. Once into safe mode go to the folder where your files are located.

Now that you are there copy the file that you want to change your boot screen too. Once you have copied that file, hit the window key + r or type %windir%\system32 in the run command, so that folder as follows.

Once there paste your new file into the folder and overwrite the existing folder.

Now that you have your new file in the folder restart your pc as you normally would and your new boot screen should appear. You can download this bootscreen here.

ALWAYS BACKUP EVERYTHING YOU EDIT OR DELETE. I'M NOT RESPONSIBLE IF YOU MESS YOUR COMPUTER UP BY HACK OR ANY TYPE OF HACK. DO IT AT YOUR OWN RISK.
