DIFFERENT WAYS HACKERS SEND YOU SERVER,VIRUSES AND .EXE FILES VIA INTERNET:>>>>
U MUST READ AND SAVE THEM>>>

----

1. Binder - Binder is a software which is used to bind or
collaborate the server or virus you have created with some other file like a MP3,JPEG or any other
file.You can fool the victim by sending him a song or picture and as soon as he opens the picture or song the
Binder also gets open and starts working.

2. Crypter - A crypter is a tool which changes the binary code of the .exe (virus,RAT etc.)file and
applies many encryptions on it
which makes the .exe file undetectable.You can use Chrome Crypter as crypter.

3. Zipping - Another smart way to send files is by putting your
server in a Zipped folder and then
sending it to the victim.Zipping
the file changes the extension of the server from .exe to .zip,which bypasses the file transfer facility of
gmail , facebook, yahoo etc..
USE WINRAR & give password of that file, so AntiVirus do not scan file.

4. Extension - You can change the extension of the Server you want to send as it is not possible to send .exe
files,so you can change the extension of .exe to .jpeg,.mp3 etc. when you save
the file and then send it to the victim.But in this method you will
have to tell the victim to change the extension back to .exe after he/she receives the server.This method can
only be used in cases where the victim is very dumb and has no knowledge of this
field.

A person who is not much interested in cyber security should have knowledge of above mentioned methods as they
can be used against anyone.
