How to Hack a Website with Basic HTML Coding If you have the HTML and JavaScript knowledge then you can access password protected websites.

Open the site you want to hack .
Provide wrong username/password combination
in its log in form
(e.g. :Username : me and Password: ' or 1=1--)
An error will occur saying wrong username-password.
Now be prepared your experiment starts from here.
Right click anywhere on that error page
=>> go to view source .
There you can see the HTML coding with
JavaScript .• There you find somewhat like
this....<_form action="...Login....">•
Before this login information copy the
URL of the site in which you are.Then delete the
JavaScript from the above that validates
your information in the server .(Do this very carefully, your
success to hack the site depends upon this
i.e. how efficiently you delete the java scripts
that validate youraccount information)
Then take a close look for
 "<_input name="password" type="password">"[without quotes] ->
replace "<_type=text> "there instead of "<_type=password>".
See there if maximum length of password is
less than 11 then increase it to 11 (e.g. : if then write)
Just go to file => save as and save it anywhere in your
hard disk with ext .html(e.g.: c: \chan.html)
Reopen your target web page by double
clicking 'chan .html' file that you saved in your
hard disk earlier.• You see that some changes
in current page as compared to original
One. Don't worry. Provide any
username [e.g.: hacker] and
 password [e.g.:' or 1=1 --]
You have successfully cracked the above
website and entered into the account of List
user saved in the server's database.
Enjoy
